Overview

Durability and Treatment

Timber Treatment extends the useful life of wood by modifying its resistance to fungal and insect attack.

TimberLab Solutions recommends the use of pre-treated full penetration CCA ACQ and TAN E (Copper AZOLE) for exterior conditions from H3.2 to H5 treatment levels.

For interior conditions we recommend pre-treated full penetration H1.2 Boron treatment.

TimberLab also offer LOSP (Light Organic Solvent Preservative) envelope treatment of the finished Glulam beams for interior clear appearance.

For in-ground application TimberLab offers H5 treatment for Glulam Posts being the superior treatment level to H4. We have the availability of H4 if specified.

TimberLab recommends all Glulam Beams and Posts cut on site; the exposed ends must be recoated to reduce end checking.
